# JavaScript Practical Tasks

Beginner Level | Functions & Arrays

## Task 1: Function – Addition

Create a function called **calculateSum** that:

1. Accepts two parameters: **num1** and **num2**.
2. Adds the two numbers.
3. Returns the result.
4. Call the function and store the result in a variable.

## Task 2: Function – Full Name

Create a function called **getFullName** that:

1. Accepts two parameters: **firstName** and **lastName**.
2. Combines both names into one string.
3. Returns the full name.
4. Call the function with your own name.

## Task 3: Function – Age Calculator

Create a function called **calculateAge** that:

1. Accepts one parameter: **birthYear**.
2. Calculates the person's age using the current year (2026).
3. Returns the calculated age.
4. Call the function with a birth year.

## Task 4: Array – Accessing Items

Create an array called **students** containing 5 student names.

1. Get the first student.
2. Get the third student.
3. Get the last student.
4. Store each item in a separate variable.

## Task 5: Array – Numbers

Create an array called **numbers** containing 6 different numbers.

1. Get the item at index **0**.
2. Get the item at index **2**.
3. Get the item at index **4**.
4. Store each item in a separate variable.

## Task 6: Function + Array

Create a function called **getArrayItem** that:

1. Accepts two parameters: **arr** and **index**.
2. Returns the item at the specified index.
3. Create an array containing 5 different colors.
4. Call the function to get the item at index **3**.

## Task 7: Function – Rectangle Area

Create a function called **calculateRectangleArea** that:

1. Accepts two parameters: **width** and **height**.
2. Calculates the rectangle's area.
3. Returns the result.
4. Call the function with different values.

**Formula:** Area = width × height

## Task 8: Array – Product Information

Create an array called **products** containing 5 product names.

1. Get the second product.
2. Get the fourth product.
3. Change the first product to a different name.
4. Add a new product by assigning it to the next available index.

## Task 9: Function – Comparison

Create a function called **getBiggerNumber** that:

1. Accepts two parameters: **num1** and **num2**.
2. Compares the two numbers using **if**.
3. Returns the bigger number.
4. If both numbers are equal, return **"Equal"**.

## Task 10: Function + Array – Student Grades

Create a function called **getStudentGrade** that:

1. Accepts two parameters: **grades** and **index**.
2. Returns the grade at the specified index.
3. Create an array containing 5 student grades.
4. Call the function to get the grade at index **2**.
5. Store the returned value in a variable.
